

SEO Audit Summary

www.drheal.in • Source: The HOTH SEO Audit • Overall Grade: **A-** ("Your page is good")

Category Scorecard

On-Page SEO	A+	Very well optimized — all checks passing
Performance	C+	Slow load; some room for improvement
GEO (AI / LLM)	D	Heavy JS rendering limits AI crawler visibility
Usability	D	Fails Core Web Vitals; poor PageSpeed scores

On-Page SEO — A+

All on-page checks pass. Title tag optimal at 55 characters ("Dr Heal Pain Hospital | Advanced Non-Surgical Treatment"); meta description optimal at 156 characters. One H1 plus a full H2–H6 structure. Keyword consistency strong (pain, treatment, hospital, care, heal, cure). Word count 946. No missing image alt attributes. Canonical tag, lang attribute (English), robots.txt, XML sitemap, analytics and JSON-LD schema all present. SSL enabled with HTTPS redirect; no noindex issues.

Only gap: no hreflang attributes (minor — only matters for multi-language versions).

Rankings & Traffic

Estimated ~15.5K monthly organic visits (0 paid; 486 from Google AI Overviews). Ranks #1 for brand terms including "dr heal pain cure hospital" (12,100 searches/mo), "dr heal", "dr heal multispeciality hospital", "heal hospital" and "drheal reviews". Cited in an AI Overview for "drheal reviews". Weaker on non-brand terms: "pain and cure" (#7), "healers hospital" (#20). 13 keywords rank at position 1, but 11 sit in positions 11–20 — the main upside opportunity.

GEO / AI Search — D

Fails LLM readability: rendering percentage of 1241% means most content is injected via JavaScript (Vue.js), which AI crawlers often don't read. An llms.txt file is present (pass). Making key content available in the raw HTML is the core GEO fix.

Usability — D

Fails Google Core Web Vitals: LCP 5.1s (poor), INP 118ms (good), CLS 0.99 (poor). PageSpeed scores: Mobile **30/100**, Desktop **41/100**. Viewport, legible fonts, tap targets and email privacy all pass.

Performance — C+

Slow load: server response 1.4s, content loaded 6.2s, all scripts complete 10.0s. Download size is fine (4.14MB; JS is the heaviest at 2.32MB). No Flash/iFrames, no JS errors, images optimized and code minified. **Failing:** outdated HTTP protocol (not HTTP/2), inline styles in use, and only 20% overall compression (CSS and images uncompressed).

Social — Strong

Linked and active across Facebook, X, Instagram, LinkedIn and YouTube (835K subscribers, 47.4M views). Facebook Pixel, Open Graph tags and X Cards all installed.

Local SEO — Mostly Strong

Google Business Profile identified (Dr. Heal Pain Cure Hospital, HSR Layout, Bengaluru) with complete NAP and a **4.6★ rating from 7,474 reviews**. **Gap:** no Local Business schema on the page.

Technical / DNS

Nginx 1.24.0 on Ubuntu; Vue.js + Element UI frontend. Valid DMARC record in place, but **no SPF record** — an email-deliverability and spoofing risk.

Priority Fixes (the report's red flags)

Priority	Fix	Why
High	Core Web Vitals & PageSpeed	Reduce unused JS/CSS, fix layout shift (CLS 0.99), speed up LCP.
High	GEO / JS rendering	Serve key content in raw HTML so AI/LLM crawlers can read it.
Med	Enable HTTP/2	Immediate page-load win over the current outdated protocol.
Med	Add Local Business schema	Improves local search visibility for the clinic.
Med	Add SPF record	Protects email deliverability alongside existing DMARC.
Low	Remove inline styles / hreflang	Code hygiene; minor SEO impact.
